Jack Fuller

Architecture

Fall 2025

ABOUT

Hello, my name is Jack Fuller, and I am currently a first-year student enrolled in the University of Tennessee, Knoxville’s Architecture program. My home is in Manhattan Beach, California. This portfolio is a curation of my work during the Fall and Winter of 2025.

PROCESSIONAL PROMENADE

The design of this promenade was a culmination of ideas and references gathered throughout the Fall semester in 2025. Previous projects that were abstractions of form and space inspired the core ideas of the structure.

The purpose of this structure was to activate an unused courtyard area between UTK's Art and Architecture building and the walkway around campus. There are three main spaces produced by the structure. One contains the small courtyard on the side with long stairs for seating and a table/counter along the curved wall. The upper deck is an open area for sightseeing and conversation. Lastly, the inner promenade has a triangular footprint with a cut out area for seating, and can be used for larger gatherings and events. The ramps and staircases provide multiple points of access and connections between these major spaces. By guiding pedestrians, professors, and students through the spaces, everyone will be encouraged to meet others and interact with the environment.

The figures above on the right are previous models that led to the conceptual understanding of space and the connections between them. The section diagram was a key inspiration for the triangular tent-like form seen in the central structure.

The bottom images showcase the site for this project. The area is enclosed by a large curved wall, a bridge attached to the pedestrian walkway, and the Art and Architecture building. I decided to flatten the slopes in between the curved walls in order to promote a more accessible outdoor area.

Rhino, Illustrator, and Google Earth

Below is an axonometric view of the structure.
To the right is a hand-drawn experiential view from the
courtyard of the sitting steps. The goal of these images is to
show how individuals can use these spaces in unique ways
to promote collaboration and engagement.

Rhino and Photoshop

Hand-drawing with the picture of the model underlaid to highlight the lighting in the interior of the promenade.

Photoshop

Physical model constructed from laser-cut chipboard overlaid over a hand-drawn experiential view from the bridge.

ELEMENTAL DRAFTS

These architectural, elemental drafts are a series of drawings I created using a combination of Rhino and Illustrator portraying different architectural elements (doors, sidewalks, and roofs) in different views (axonometric, perspective, sectional, etc.) Making these drawings opened a new pathway of understanding how all elements are interconnected through the spaces they create. They also taught me valuable skills regarding digital drawing applications such as Rhino and Illustrator.

The drawing on the right depicts a confined sidewalk in Venice, Italy, defined by the homes on the left and the canal on the right. The section-perspective view is utilized to help viewers experience the space of the sidewalk as you would in real life due to the distorted dimensions caused by perspective.

Rhino and Illustrator

Below are frames from an animation of a garage door opening and closing. The right page features pen drawings of doors (a microwave on top and a gate on the bottom) that were later used to make high-quality draftings featured on the far right.

An axonometric view was used in order to maintain all dimensions relative to each other, not relative to the distortion of a camera or the eye. Learning to draft in this way helped me better understand how axonometric views can be used to represent and present ideas.

Rhino and Illustrator

Below is a drawing of the Pentagon in Arlington, VA;

in Inglewood, CA.

Rhino and Illustrator

Roof of the Mercedes-Benz Stadium in Atlanta, GA
featuring an opening mechanism similar to the opening of
a flower.

Rhino and Illustrator

Sidewalk in Shinjuku City, Japan (in Tokyo), with many shops on one side and large office buildings on the other divided by a large road.

Rhino and Illustrator

When drawing sidewalks, a section perspective representation was used instead of an axonometric view. This was done to give a more experiential view of the sidewalk, as the section cut shows the space of the sidewalks and the perspective makes the scene look more natural to the human eye.

SPATIAL MEMBRANE

In this project, I manipulated a singular, rectangular surface to create a variety of spaces and interesting pathways for pedestrian use. The focus was on morphing the surface while still maintaining a smooth form in order to recognize the original plane.

To make the complex twists, bends, and holes, I learned many new operations in Rhino. By researching how different objects interacted with my surface to instigate the creation of space, I was able to develop areas on the same surface with unique experiences.

MODULAR AIRPORT TERMINAL

Inspired by the complexity of airports with their many different crucial functions, I designed a new layout for terminal passageways that combine retail, dining, and transit into one compact footprint.

All three modules contain the central elevated “highway” featuring two moving walkways and a pathway in the middle for accessibility transport. One module features four stairways and an elevator to allow people to get from one level to the other. The other two modules have four gates along the sides with shops and restaurant spaces below the walkway. There is a version with three different stores and another with one large space.

This project was important because it led me to learn how to design for more specific programs and how to present ideas in multiple different ways. For example, in this project, I explored axonometric views, sectional perspective views, and realistic renders.

Rhino

This module has one space for shopping with two gates on either side. The space underneath the walkway allows for travelers and shoppers to pass from one side to the other while also having the opportunity to quickly browse for snacks, clothing, etc.

Rhino and Illustrator

The stair/elevator module is necessary for allowing people to exit the walkway and get to the level consisting of their gate and retail areas. The underpass provides the opportunity to switch sides, while also providing access to bathrooms in the spaces beneath the walkway. Finally, the elevator is necessary for those with heavy luggage and/or disabilities.

Rhino and Illustrator

The three-store module is very similar to the first. Instead of one open retail space, the area is divided into three counter-front dining spaces. There is no access to the other side in this module; however, this gives the retail owners more room to operate in the already confined setting of the airport.

Rhino and Illustrator

Sectional view of the terminal with all modules
in a line, creating a long pier for airplanes to effectively
exchange passengers.
